All-On-4

This is a full set of teeth attached to four implants, it can only be removed by your dentist.

If you have this solution, be sure to brush your teeth as normal. You need to use a water flosser where your new teeth meet your gums. This uses a jet of water to remove plaque and food particles.

Your dentist may remove your new teeth once per year to clean underneath and check the health of your implants and gums.

Top tips for implant care

Brush your teeth twice daily and rinse with a daily mouthrinse.

Use special brushes or floss to clean the areas that your toothbrush cannot reach.

Your dental care professional will guide you on what aids are best depending on your prosthesis design and angulation.

Visit your dentist regularly to have your implants and any remaining natural teeth checked and professionally cleaned.

Remember

The long term success of your implant depends on how well you care for it.

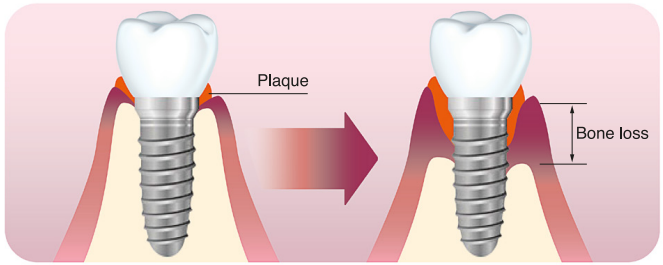
Caring for your

Dental Implants

Cleaning around your dental implants is just as important as cleaning around your natural teeth, both depend on healthy gums and bone levels for support. It's up to you to help them last a lifetime.

Your implant cannot decay. However, it is very important to keep them free from plaque to prevent gum problems. This is often caused by insufficient cleaning and the buildup of plaque. Lack of care can result in the loss of an implant.

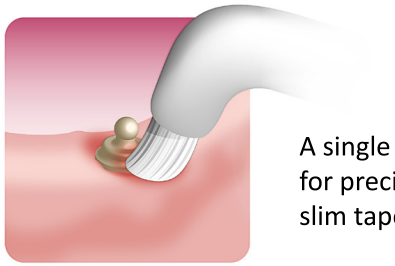


Twice daily cleaning is essential to keep your implants healthy. See your dentist or hygienist every six months to check the health of your gums and implant.

Special Brushes for Cleaning

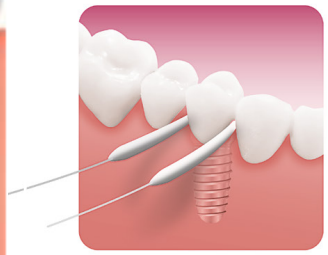
The array of dental products available can be confusing. Here are some of the best and their uses:

Implant Care brushes have a specially angled head to reach the insides of your implant.



A single tuft brush is great for precise cleaning with its slim tapered bristles.

Interdental brushes clean between teeth and implants. They clean the sides of the teeth where the toothbrush cannot reach.



Floss is also a good aid to clean around implants. Sometimes a special floss called "Superfloss" is a better option.

How do I clean my implant?

Ask your hygienist or dentist for instructions tailored for your needs. In general:

Single implant

If your implant replaces one missing tooth, you should brush and floss in the same way as your natural teeth. If you don't like flossing, we recommend the use of an interdental brush.

Implant bridge

When you have multiple implants supporting a bridge or several teeth, it is important to clean the area between the bridge and the gum as well as around the posts holding the bridge in place. Superfloss or interdental brushes are good cleaning aids for these cases.

Overdenture

An overdenture is removable, but is secured to your implants through retentive attachments incorporated into the denture. A single tuft brush is perfect for precise implant cleaning.
